Aging and Your Eyes

What vision changes are normal with age?

- Needing glasses to see up close.
- Having trouble adjusting to glare.
- Having difficulty telling apart some colors.
- Needing more light to see well.

Are vision loss and blindness a normal part of aging?

No! But as you age, you are at higher risk for developing age-related eye diseases and conditions:

- Age-related macular degeneration (AMD)
  Damage to the macula of the eye.
- Cataract
  Clouding of the lens of the eye.
- Diabetic retinopathy
  Damage to blood vessels in the retina.
- Glaucoma
  Damage to the optic nerve.
- Dry eye
  Eyes do not make enough tears.
- Low vision
  Difficulty seeing, even with glasses, medicine, or surgery.

Are there warning signs?

Many eye diseases have no early warning signs but can be detected through a comprehensive dilated eye exam.

What can I do to protect my sight?

- Have regular dilated eye exams.
- Know your family’s eye health history.
- Be physically active.
- Eat a diet rich in fish and green leafy veggies.
- Control your diabetes if you have it.
- Stop smoking.
- Wear sunglasses and a brimmed hat outside.
- Wear protective eyewear when working around your house or playing sports.

What if I’ve already lost vision?

Help is available. Talk with your eye care professional about vision rehabilitation.
